

# PRISM System

## What We Do, How It Works, and Why It Matters

PRISM is an AI-powered campaign intelligence platform developed by Aras Integrasi Sdn. Bhd. It combines real-time news and sentiment monitoring, forecasting electoral modelling, ground canvassing, and a fleet of autonomous AI agents into one command-and-control interface, giving leadership a live, data-driven view of the electoral landscape and turning raw signals into clear decisions.

## At a Glance

|                         |                                                                          |
|-------------------------|--------------------------------------------------------------------------|
| <b>What it is</b>       | An AI-powered campaign intelligence and command platform                 |
| <b>Who it's for</b>     | Campaign directors, coordinators, and ground teams                       |
| <b>What it delivers</b> | Live electoral insight, predictions, and field coordination in one place |
| <b>How it runs</b>      | Continuously, 24/7, via automated data feeds and AI agents               |
| <b>Key added value</b>  | The more data it receives, the more accurate and valuable it becomes     |

## What We Provide

The platform brings together a connected set of intelligence and operations services:

- Real-time monitoring: news and social media sentiment tracked across all constituencies.
- Forecasting modelling: win probability, confidence level, and swing-to-flip for every seat.
- AI assistant: ask questions about the campaign in plain language and get instant answers.
- Scenario simulation: model how projections shift under different what-if conditions.
- Ground canvassing (*Optional*): structured doorstep reports from volunteers, including voice capture
- Visual intelligence: electoral heatmap, constituency detail pages, and a narrative monitor.

## How the System Is Built

PRISM is organised into four working layers. Together they operate as one connected system rather than separate tools.

| Layer                 | What it does                                                                 |
|-----------------------|------------------------------------------------------------------------------|
| <b>Command</b>        | Day-to-day dashboards, AI chat, heatmap, and monitoring views for leadership |
| <b>Operations</b>     | Scenario simulation, resource optimisation, and volunteer management         |
| <b>Intelligence</b>   | Voter segmentation and analysis of canvassing results                        |
| <b>Administration</b> | Data connections, scraping schedules, and user management                    |

Behind these layers, PRISM runs on a secure multi-database backend (for records, relationships, and smart search) and pulls from a range of external news and data feeds. The technical detail is kept light here on purpose.

## The AI Agent Fleet

A team of autonomous AI agents runs around the clock, each handling a specific job and feeding the others:

- News & content: gathers and tags incoming news and social posts in near real time.
- Prediction: scores every seat with an up-to-date win probability.
- Risk & escalation: flags constituencies that cross a risk threshold and drafts alerts.
- Content integrity: screens for misinformation and inauthentic activity.
- Messaging simulation: tests likely public reaction to messages before they go out.
- Trend scouting: spots emerging topics early, before they hit the mainstream.

## How It Works

PRISM runs as a continuous loop, not a one-off report:

1. Data comes in - automated news and social feeds, plus field reports from volunteers on the ground.
2. AI processes it - agents curate, tag, check, and score the data, and flag anything urgent.
3. Insight goes out - results appear in dashboards, heatmaps, alerts, and the AI assistant.
4. Decisions are made - leadership directs budget, messaging, and ground effort.
5. New data is created - that activity generates fresh data, and the cycle repeats.

## The Added Value

The most important thing to understand about PRISM is that it improves the more it is used. Every news cycle, every volunteer report, and every canvassing session adds to the data the system learns from. As that data grows, predictions get sharper, risk signals get more reliable, and recommendations get more precise. In short, the more data fed into the system, the better it gets - and the greater the advantage it delivers over time.
